Folding and crumpling of thin elastic sheets: statistical analyses of geometrical and energetical properties

Stéphanie Deboeuf

Laboratoire PMMH, ESPCI

Invité par Cindy Rountree

Abstract : DNA packaging in viral capsids, or plant leaves growing in buds, are some examples of close-packed low dimensional biological structures. We study the purely mechanical counterparts, such as folded rods and crumpled sheets. I will present our results about geometrical and energetical properties of an elastic sheet, in two compaction experiments. The first experiment consists of pulling a circular polyester sheet from its center through a smaller rigid hole acting as a container (quasi-2d compaction). In this geometry, it is possible to simultaneously record the applied force and observe the folded configurations. Despite the wide variety of possible folded patterns, related to a very complex energetical landscape, elementary patterns are identified, whose geometrical properties and elastic energy, are directly measured. The second experiment consists of crumpling by hand a paper sheet (3d compaction). Geometrical properties are measured in the folded configurations. Characteristic length-scales of these crumpled 3d-networks are extracted and compared with other studies from the literature. Our results suggest to focus on these elementary patterns (like “particles”), in order to understand “thermal equilibration” in close-packed systems, and microscopic distributions of energy, by means of statistical physics tools.

Formalités d'entrée : Contacter le secrétariat pour l'établissement de votre autorisation d'entrée sur le centre de Saclay. Tel : 01.69.08.65.32 ou 01.69.08.40.12; Fax : 01.69.08.40.44; e-mail : catherine.julien@cea.fr. Le délai minimum est de 21 jours pour les visiteurs ressortissants des pays de l'Union Européenne, et de huit jours pour les autres. Sans autorisation, vous ne pourrez entrer sur le centre de Saclay. Dans tous les cas, se munir d'une pièce d'identité.
