Magnesium and its alloys exhibit a particularly complex and interesting mechanical response characterized by a high level of plastic anisotropy resulting from the simultaneous activation of both slip and twin deformation modes. This gives rise to the development of relatively complex microstructure.

The author will present some of his most recent work aiming at providing a multiscale understanding of the processes of (i) latent hardening resulting from dislocation interaction, (ii) twin nucleation, (iii) twin growth and (iv) twin interactions. The strategy employed relies on the use of atomistic simulations, discrete dislocation dynamics and mean-field micromechanics. In parallel, to provide guidance for modeling developments, the author will present a novel automated image recognition tool allowing for the detection of twins in EBSD map so as to probe for statistically meaningful links between microstructure evolution and loading condition.

Les visiteurs de nationalité étrangère hors Union Européenne sont priés de bien vouloir avertir impérativement 3 semaines à l'avance, et ceux de l'Union Européenne 1 ou 2 jours avant le séminaire, le Secrétariat du Service de leur entrée sur le Centre : Tel : 01 69 08 66 64 - Fax : 01 69 08 68 67.
